How to set command line parameters in Visual Studio

On the main IDE window's menu bar choose Project -> [project name] Properties. That opens the project's property pages. You can specify command line arguments under Configuration Properties -> Debugging -> Command Arguments. Just type in exactly what you would type at the command line after the program name.

If Joe wants the look command line to like this:

joesprogram.exe -I foo -U "bar baz"

Joe would put this in the command arguments field:

- I foo - U "bar baz"
