

# Designing Parallel Algorithms: Parallel Sum example

Thursday, August 23, 2018 11:53 AM

ssh pleiades.tricity.wsu.edu

plaza.com

Example: Sum of  $n$  numbers.

Input: An array  $A[0..n-1]$  containing integers

Output:  $\sum_{i=0}^{n-1} A[i]$

Algorithm: (serial)

```

int sum(A[0..n-1])
{
    s = 0
    for (i = 0 to n-1)
        sum = sum + A[i]
    return s;
}
    
```

$T(n) = \Theta(n)$

$\omega = \Theta(n)$

Assume: Distributed Memory Model

$p$ : # processes  $\{p_0, p_1, \dots, p_{p-1}\}$

$n = p$

time steps spent waiting + time to compute

$$T(n, p) = \Theta(p-1) + \Theta(1)$$

communication      comp.

$\Theta(p)$  # time steps

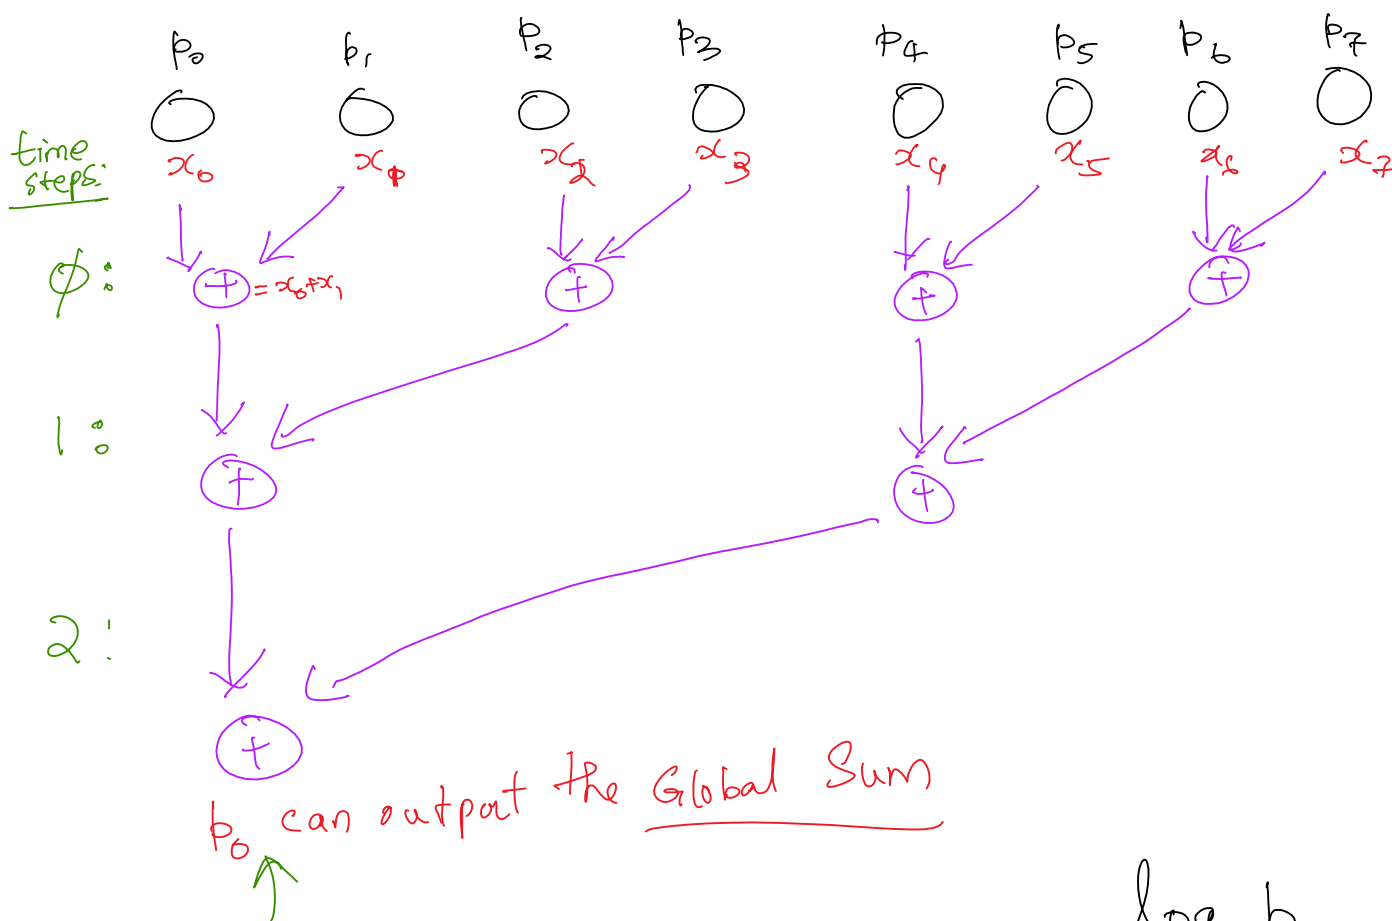

# Parallel Sum
